

ABSTRACT OF THE DISCLOSURE

[00147] A portable air temperature controlling device useful for warming air surrounding
an aerosolized drug formulation. Warming the air of an aerosol makes it possible to
5 reduce the diameter of aerosol particles produced by an aerosol generation device.
Additionally, warming the air forces the diameter of the aerosol particles to be in the
range required for systemic drug delivery independent of ambient conditions. Smaller
particles can be more precisely targeted to different areas of the respiratory tract.
